CT et IRM et injection IV de Contraste

- 1. Phase artérielle (néphrographie vasculaire /corticale)
 - 15 - 90 s
- 2. Phase portale (néphrographie tubulaire)
 - Optimum : 70 -90 s
- 3. Phase tardive (excrétoire) :
 - après 3-5min
 - Opacification des cavités pyélocalicielles

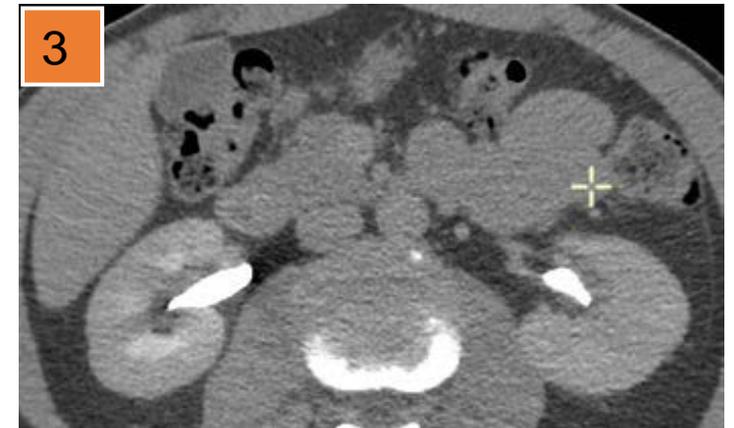

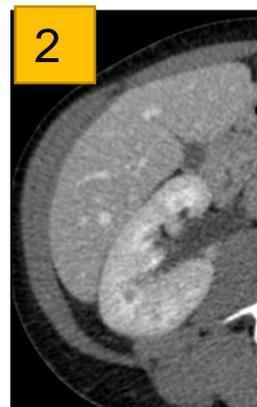

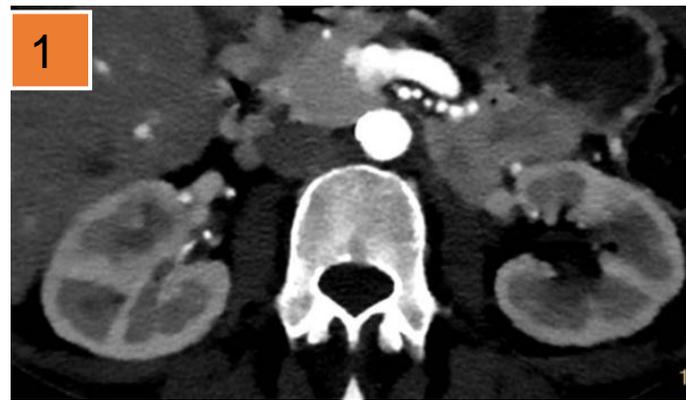

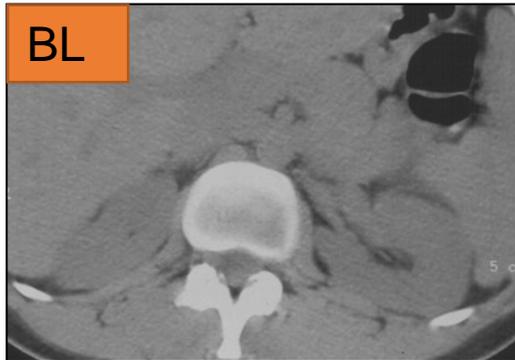

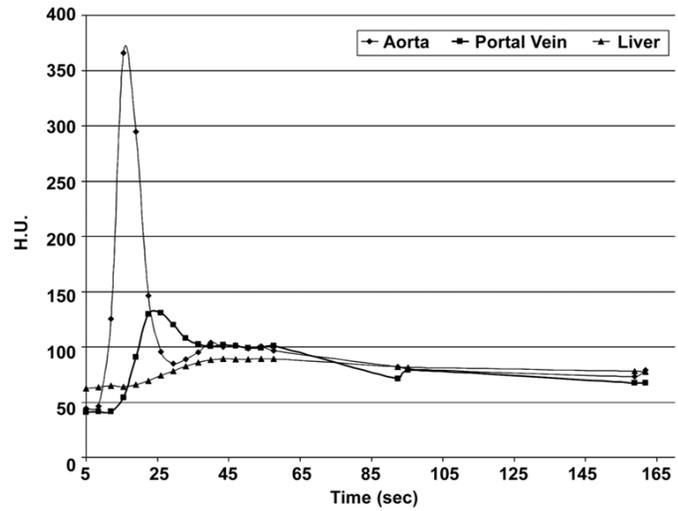

Figure 4b. CT liver perfusion images and graph that shows enhancement curves.
